HANEL

for pinpoint occlusion

Occlusal testing and correction are two of the most demanding techniques in modern dentistry. Occlusal interference may cause dysfunctions leading to damaged teeth and pain for the patient. To avoid occlusal interference even the smallest high spots have to be traced. This art requires materials which will mark effectively and reliably in different conditions and on different materials.

The HANEL line includes a range of products for occlusal testing in the laboratory and dental practice. The materials have the correct thickness, elasticity, tensile strength and colour required by dentists for their gnathological work when locating pinpoint, surface or linear contacts, stops and microcontacts.

To complement the different test materials, HANEL also offers a range of accessories to make handling even easier.

Contents

Paper.....	6 - 7
Foil.....	8 - 9
Silk.....	10 - 10
Shimstock.....	11 - 11
Spray.....	12 - 13
Instruments.....	14 - 15
Accessories.....	16 - 17

Explanation

-  single sided, one colour
-  Double sided, one colour
-  Double sided, two colours

Representation of occlusal contacts obtained with different thicknesses of test materials

200 µ Paper

Thick test material. Areas of high pressure cause larger marks.

80 µ Silk

Highly differentiated colour transfer, medium fine with progressive markings, supple

80 µ and 40 µ Paper

Medium fine test material

12 µ Foil

Fine test material for pinpoint marking of high spots

In our experience the following colour/material combinations can be recommended:

- Gold blue
- Amalgam green/red
- Composites blue/red
- Porcelain blue

Blue foil is best used on particularly shiny surfaces (Gold, Porcelain) because of its contrast to the flesh coloured soft tissue.

Articulating Paper

Articulating Paper 200 µ

For the first stage of testing, to differentiate between areas of high and low masticatory pressure

- progressive markings: the lower the masticatory pressure, the lighter the marking and vice versa
- available as strips in a practical dispenser box
- occlusal adjustment is simplified by the progressive markings
- antistatic - easy to handle

300 Sheets
(18 mm x 50 mm)

REF

480 392

480 397

Articulating Paper 80 μ + 40 μ

For medium fine testing

Available on rolls, or I-, C- and U-form sheets for easy, quick and precise marking. The use of tweezers is not necessary.

- double sided
- papers are available in one or two colours
- deep colours for good marking

			80 μ	40 μ

Occlusion Foil

22 mm

Occlusion Foil 12 µ

For precise occlusal adjustment

The HANEL foil fulfils all the requirements needed for today's gnathology. The biaxial characteristics of the foil ensure that it is highly tear resistant yet elastic. It is extremely fine and the precise colour transfer guarantees pinpoint markings on high spots.

The 22 mm wide foil is available in single-sided, double-sided one coloured and double-sided two coloured. For the 22 mm wide foil a practical dispenser is available with an integrated cutter.

The 80 mm wide foil is available single-sided or double-sided one coloured in a practical dispenser box.

- extremely thin
- very pliable
- pinpoint marking of stops and microcontacts
- non toxic colour layer
- no smearing

ories please see page 16

Articulating Silk 80 µ

High quality natural silk. A medium fine material with progressive colour transfer, for use in the laboratory and dental practice.

- excellent tracing capacity
- extremely supple
- progressive colour transfer

22 mm x 10 m

80 mm x 10 m

Shimstock-Foil 8 μ

For a precise end check

The Shimstock-Foil is a metal foil without a colour coating. When the teeth are in normal occlusion, this foil can be pulled through the ground-in contacts. If a muscle tonus exists, the foil is held back.

Occlusion Spray

Okklu - top

For checking approximal contact points and on interior surfaces of crowns and bridges, in the lab.

- extremely fine grain
- the colour is sprayed uniformly
- the special capillary nozzle allows precise spraying even in small areas
- good markings on gold, ceramic and plastic teeth
- even small contact points can be identified
- no irritation of the respiratory tract
- non sticky
- can be easily removed with water or alcohol
- CFC free

Can (75 ml)

REF

480 411

Ghm - Spray

The Ghm - Spray is ideal for use in the crown and bridge technique in the lab. It is available in a practical 100 ml spray can.

- precise application through use of nozzle pipe
- can be easily removed with water or alcohol
- CFC free

Can (100 ml)

C P M Contact-Point-Marker

For exact marking of approximal contacts

The CPM offers a more efficient and accurate way to check the approximal contact areas when trial seating single crowns, bridge-works, inlays/onlays and facial veneers.

New Design:

The fork is now positioned to allow more space when trial seating crowns and bridges.

- optimal ergonomic design
- holds foil tight
- easy mounting, foil can be quickly changed
- polyester strips for polishing composite fillings can also be inserted in the fork
- can be sterilised
