# I. Technical details

The taper size of the instrument indicates how much the instrument diameter increases per hundredth millimetre

# 1. Design

Markings for Easy Instrument Identification

#### The number of rings on the shaft

indicates the instrument's taper size:

e.g. 1 ring = taper .04

Mtwo® taper .04 1 ring
Mtwo® taper .05 2 rings
Mtwo® taper .06 3 rings
Mtwo® taper .07 4 rings

#### The ISO colour coding

indicates the size of the instrument's tip: e.g. purple ISO  $10 = \emptyset$  0.10 mm

#### **Depth markings**

help to control the working length during preparation: e.g. an  $M_{two}$  10/.04 with a working length of 25 mm has depth markings at 18, 19, 20 and 22 mm, starting from the instrument tip.

Working length: Depth markings at:
21 mm 18, 19 and 20 mm
25 mm 18,19, 20 and 22 mm
31 mm 22 and 24 mm

The taper .0X indicates how much the instrument diameter increases each millimetre from the tip towards the instrument shaft in hundredths of a millimetre. An  $M_{two}$  instrument size 10/.04 e.g. has a tip diameter of 0.10 mm. One millimetre from the tip, the diameter is 0.14 mm, two millimetres from the tip the diameter has already increased to 0.18 mm. Sometimes taper is expressed as a percent, e.g. Taper 4% or Taper .04.

#### Benefits of Mtwo® instruments with different tapers:

- Early removal of obstructions in the coronal root canal section by using a larger instrument diameter compared to conventional ISO hand instruments.
- Fast and efficient preparation of the root canal with only a few instruments.
- Increased conical shaping for efficient irrigation.

#### **Special Features**

Mtwo® instruments are available with different working part lengths. In the basic sequence, there are instruments with working part 16 mm and 21 mm. Instruments with a working part of 21 mm do not have any depth markings.

#### Advantage of 21 mm working part

While preparing the root canal, the instrument removes obstructions in the pulp chamber without unnecessarily weakening the tooth substance.

#### Cross-section

 $M_{two}^{\circ}$  instruments have an s-shaped cross-section and two efficient cutting edges. In addition,  $M_{two}^{\circ}$  is designed with minimum radial contact as well as large and deep flutes for continuous upwards evacuation of dentine chips. The instrument core is designed for maximum flexibility, however, without compromising the instrument's strength.

 $M_{two}$ ° instruments with higher ISO sizes and tapers have a reduced cross-section. This design ensures the flexibility of the instrument and facilitates maintenance of the natural canal curvature even for larger apical preparations (e.g. with an  $M_{two}$ ° 35/.06).

#### **Advantages**

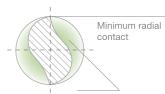

- No blocking with dentine chips
- No blocking of instruments
- High flexibility

#### Non-cutting Tip

#### S-shaped cross-section

Large and deep flutes for continuous removal of dentine chips

Reduced cross-section

#### Shaft Length

A shaft length of 11 mm facilitates easier access to molars.

35/.04

# 2. Instrument Design and Benefits

Specific instrument design for safe and fast preparation

The specific instrument design ensures safe and fast preparation.

Reliable mechanical glide path for initial preparation with instrument sizes 10/.04 and 15/.05

A large and constant helical angle (i. e. more spirals) increases the instrument's stability.

Efficient dentine removal and precise shaping with instrument sizes 20/.06 and 25/.06

Active cutting blades and a progressive pitch enable efficient dentine removal and excellent lateral cutting ability as well as automatic upwards transport of debris. Undesired screw-in effects are prevented.

Efficient preparation without unnecessary loss of tooth substance with instrument sizes 30/.05, 35/.04, 40/.04

Instruments with a reduced taper enlarge the apical third without unnecessarily weakening the tooth. The reduced mechanical stress inside the canal ensures a safe preparation.

Trouble-free preparation of larger canals, e.g. with instrument sizes such as the 50/.04 or 40/.06

A reduced cross-section for instruments with larger ISO sizes and tapers ensures instrument flexibility and safe root canal shaping.

II. The Mtwo® Technique

# Automatic file progression Brushing file movement

# 1. Simultaneous Shaping

M<sub>two</sub>® cuts both on penetration and laterally. The instrument advances automatically from coronal towards apical, supported by the brushing file movement.

The **brushing file movement** is used, when resistance is felt during progression. The instrument is pulled back 1-2 mm and the file is used in a brushing movement with light lateral pressure against the canal wall (see illustration). This creates space for the instrument to progress automatically towards apical without pressure involved. The root canal is thus prepared to full working length by each instrument.

1 Insert the rotating instrument into the root canal without touching the walls of the canal.

2 Exerting light pressure, allow the instrument to touch the canal wall.

3 Make small, stroking/ brushing movements (over a few millimetres) in a coronal direction, without taking the instrument out of the canal. (Similar to using a Hedstroem file).

4 Allow the instrument to move apically for a few millimetres and then repeat the movement described under 3. Gradually advance step-by-step towards the apex with up and down movements.

As soon as full working length has been reached, change to the next instrument in the sequence.

# 2. Benefits of Simultaneous Shaping

#### Selected Shaping

The instrument finds its way in the canal automatically. If it feels as if the instrument is only progressing slowly towards apical, switch to lateral preparation of the canal wall (brushing file movement) to enable the instrument to automatically advance further. This procedure prevents over-preparation of the obstructed area and ensures a continuous conical preparation of the root canal to full working length.

Continuous conical shaping

#### Reliable Mechanical Glide Path

All instruments are brought to full working length, preparing the canal gradually while maintaining the original canal anatomy. The instrument design enables each instrument to prepare a glide path for the following instrument and ensures conical canal shaping. Preparation errors can thus be avoided.

Each instrument prepares a glide path for the next

#### Preparation without Unnecessary Loss of Tooth Substance

Compared to the coronal enlargement created by the crown-down technique, Simultaneous Shaping only removes as much substance as needed for progression towards the apex. Preserving the tooth substance during preparation prevents unnecessary weakening of the tooth and thus reduces the risk of root fractures.

Minimum loss of tooth substance

#### Preparation of Irregular Root Canal Anatomies

Mtwo®'s Simultaneous Shaping technique allows for preparation e.g. of oval or dumb bell-shaped anatomies. This technique in combination with the instrument's high flexibility allows for preparation of demanding root canal structures with all instruments during all stages of the preparation.

Preparation of oval canals

**Simultaneous Shaping** allows precise preparation, creates a reliable glide path, prepares the root canal without unnecessary loss of tooth substance and enables safe preparation of irregular canal anatomies.

III. Preparation and Retreatment

# 1. One Sequence for All Canal Anatomies

#### **Initial Steps**

#### Create a Glide Path

Check the patency of the canal and create a glide path to the apical constriction or the foramen apicale to at least an ISO size 10.

#### C-PILOT® File

ISO 06 → ISO 08 → ISO 10

#### **Determine the Working Length**

Electronic length determination of the root canal using an apex locator and a C-PILOT® file.

#### **Enlarging the Canal Access**

Through the brushing movement (see page 8) and the instrument's excellent lateral cutting efficiency,  $M_{two}$  can even remove obstructions in the coronal third. The canal entrance is gradually and systematically enlarged through the use of each instrument.

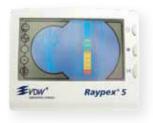

A separate enlargement of the canal access is, therefore, unnecessary. Should you, however, wish to enlarge the canal access, an  $M_{\text{tWO}}$  25/.06 can be used.

#### Mtwo® Basic Sequence

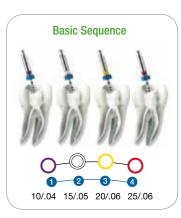

There is one single sequence for all root canals. The sequence follows the **Single Length Technique**, i.e. all instruments are brought to full working length. The first instrument, a 10/.04 is gradually brought to full working length using the brushing file movement, however, without exerting any pressure. As soon as working length has been reached, change to the next instrument in the sequence. Continue working this way through the basic sequence. Each instrument **creates a glide path for the following instrument**.

If the working length is reached easily in larger canal anatomies with hand instruments sizes 15 or 20, Mtwo® preparation can be started using an Mtwo® ISO size corresponding to the hand instrument used, i.e. Mtwo® 15/.05 or 20/.06.

One sequence for all root canals All instruments are brought to full working length

#### Recommendations for Problem-Free Use

- ✓ If the instrument does not advance in the canal, pull it back 1-2 mm and work with brushing movements on the canal walls to widen the canal. The file should then advance without exerting pressure.
- ✓ Irrigate the root canal according to the appropriate irrigation protocol.
- ✓ The chelator FileCare®EDTA will facilitate the progression
  of the instrument in the canal.

#### Warnings

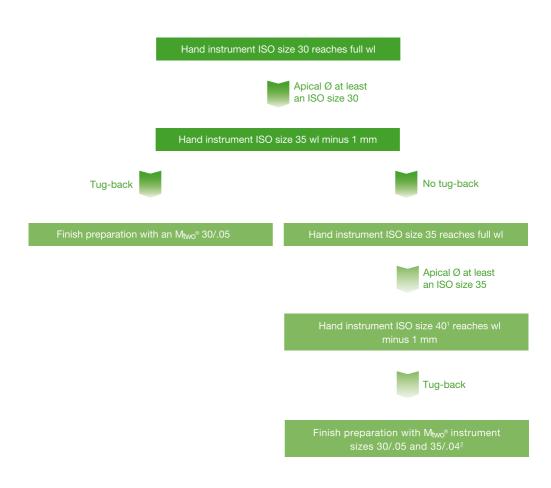

- △ Do not probe the pulp chamber floor with the M<sub>two®</sub> 10/.04!
- △ Do not use the instrument in a picking movement!
- △ Do not force the instrument to reach working length!
- △ Bring the instrument to working length only once and then proceed immediately to the next instrument in the sequence!

# 2. Further Shaping

Determination of the Apical Preparation Size – Apical gauging After preparation using the  $M_{two}$ ° basic sequence (size 25/.06), the diameter of the canal is measured at full working length by inserting a hand instrument size 30. If the hand instrument size 30 can be inserted (light tug-back) to 1 mm short of full working length (wl minus 1 mm), the apical part does not need further enlargement.

Should the hand instrument size 30 reach full working length, a further apical enlargement is required. The preparation size necessary for the apical enlargement can be determined based on the following:

Apical gauging

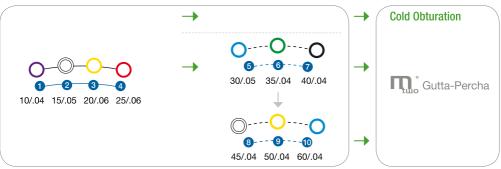

<sup>&</sup>lt;sup>1</sup> If needed, repeat the procedure with larger hand instruments until tug-back is reached 1 mm short of full working length.

 $<sup>^2</sup>$  The final assessment can be carried out using a hand instrument ISO size 40, in order to determine whether there is a slight tug-back 1 mm short of full working length. If this is the case, preparation with  $M_{tMO}$ ° size 35/.04 is complete.

#### **Preparation of Larger Canal Anatomies**

After preparation with the  $M_{two}$ ° basic sequence, the apical canal section can be enlarged with further  $M_{two}$ ° instruments. As required, the apical part can be prepared up to an ISO size 60. For easy cold obturation and an optimum obturation result, we recommend  $M_{two}$ ° Gutta-Percha, which is perfectly in line with  $M_{two}$ ° preparation.

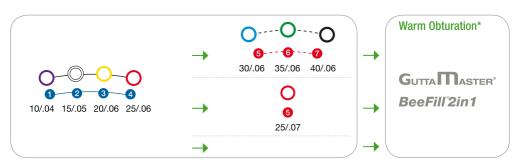

#### **Preparation for Warm Obturation Techniques**

Warm obturation techniques require a higher conicity compared to cold compaction techniques. A larger conicity prevents extrusion of filling material (gutta-percha) beyond the apex, as this shape offers higher resistance.

Depending on the size of the apical preparation and the conicity of the canal, the following  $M_{two}$ ° instrument sizes can be used after the **basic sequence:**  $M_{two}$ ° sizes 25/.07, 30/.06, 35/.06 and 40/.06.

<sup>\*</sup> For further information on VDW's three-dimensional obturation systems GuttaMaster<sup>®</sup> and BeeFill<sup>®</sup>2in1, please consult our website: www.vdw-dental.com.

## 3. Retreatment

Mtwo® retreatment files are designed specifically for removal of root canal filling material. Retreatment of carrier-based fillings (e.g. GuttaMaster®) is also possible. The retreatment files offer the following design features: a cutting tip and a constant helical angle which ensure the instrument's easy progression into the gutta-percha filling, without the need to exert pressure.

Retreatment File with Cutting Tip

To remove the gutta-percha filling material, brush the canal walls with light lateral pressure (Simultaneous Shaping). The Mtwo® retreatment range offers you the following instruments: the R15/.05 for narrow root canals and the R25/.05 for wide and medium root canals.

#### Retreatment Recommendations Using the M<sub>two</sub>® R 25/.05

- Remove the gutta-percha from the coronal third using a Gates Enlarger or an ultrasonic tip. If needed, soften the gutta-percha with a solvent (e.g. eucalyptus oil, orange oil)
- ✓ Place the instrument tip on the gutta-percha filling and remove the gutta-percha with rotating, brushing movements. Do not take the instrument to full working length.
- ✓ Manually enlarge the apical part with a hand instrument ISO size 15. Then prepare the root canal with an M<sub>two®</sub> instrument to the desired size.

R 15/.05 for narrow canals

R15/.05

R25/.05 for wide and medium canals

R25/.05

**IV. Tips and Tricks** 

IV. Tips and Tricks

#### How often can Mtwo® instruments be used?

It is safest to use  $M_{tWO}^{\circ}$  instruments only once. Should you use an  $M_{tWO}^{\circ}$  instrument more than once, it is very important to document the frequency of use by means of control stickers. The number of times an instrument can be used depends on the strain put on it during root canal preparation.

Examine the Mtwo® instrument visually for signs of material fatigue after use. Optical means of magnification are very helpful: e.g. magnifiers, dental loupes and microscopes. Discard the instrument immediately if it shows the following defects:

- △ Instrument bent (plastic deformation)
- △ Spirals deformed
- Cutting edges damaged
- Cutting edges blunt
- △ ISO colour coding missing
- △ Corrosion

Mtwo® Control Stickers
Autoclavable, use waterresistant marker

Large, almost straight canals (e.g. front teeth)

max. 8 canals

Canals with small or medium curvature (e.g. premolars) XX max. 4 canals

Narrow and extremely curved canals (e.g. molars)

XXX max. 2 canals

Is it necessary to clean the instruments during root canal preparation?

We recommend removing accumulated debris from the instrument during preparation by using an interim stand. The instrument is cleaned by simply inserting the instrument into the foam disk. This procedure prevents debris from accumulating in the instrument's flutes which would increase the friction within the canal.

# When should the working length be determined with an apex locator?

When starting root canal treatment with rotary nickel-titanium instruments, the canal patency should be determined with a hand instrument, and a glide path should be created. The working length should be determined with an electronic apex locator and the hand instrument before using an  $M_{two}$ ° instrument. In order to verify the working length, e.g. in curved canals, the measuring result can be rechecked after each  $M_{two}$ ° instrument.

# Is it necessary to enlarge the canal access before preparation with $M_{two}^{\circ}$ ?

The brushing file movement and the excellent lateral cutting efficiency of  $M_{two}$  ensure removal of obstructions within the coronal third. Thus, with every instrument used, the canal access is gradually enlarged. A separate root canal enlargement is, therefore, not mandatory. However, the canal access can be enlarged with an  $M_{two}$  25/.06, for example.

# How to determine if the apical preparation size has been reached?

After carrying out apical gauging and subsequent preparation, a visual inspection can be carried out. Humid or red debris located on the lower instrument third is a signal that further apical preparation is necessary. Dry and white dentine chips however mean that the apical target size is reached.

# When to irrigate the root canal most efficiently during preparation with M<sub>two®</sub>?

The root canal can be irrigated at any time during preparation. Thanks to the instruments' conicity in combination with Simultaneous Shaping to full working length, irrigation of the root canal can already be carried out after use of the second  $M_{\text{two}}^{\text{e}}$  instrument size 15/.05 to 3 mm short of full working length. We recommend using an ISO size 30 irrigation cannula.

**V. Motors** 

Rotations per minute (rpm)
Torque limit (gcm)

For safe and easy preparation with  $M_{two}$ <sup>®</sup>, we recommend using an endodontic motor with torque control.

Mtwo®'s speed range is 250 to 350 rpm. The VDW.GOLD® and VDW.SILVER® motors are programmed for Mtwo® at a speed of 280 rpm with constant revolutions.

Each instrument has its pre-programmed torque limit. Generally, the torque limit improves the instrument's safety and protects it from overcharge, provided that the instrument is used appropriately and that the frequency of use is limited. The motor insures that the instruments are driven in a precise and reliable manner, according to their specific mechanical values.

#### **Directions for Use**

- ✓ Choose an M<sub>two®</sub> instrument and the corresponding motor setting.
- ✓ Insert the rotating instrument tip into the canal while avoiding contact with the canal walls.
- Do not exert any pressure on the contra-angle.
- ✓ The instrument will progress automatically towards apical using brushing file movements.
- ✓ A torque alarm signal indicates stress/friction on the file. The more frequently the alarm sounds, the higher the stress on the instrument.
  Possible reasons:

## **Audible Warning Signal**

Causes	Solution
Forced progression of the instrument in the root canal	Pull instrument back 1-2 mm and create more space with brushing movements
Too much pressure exerted on the contra-angle	Reduce pressure
Increased instrument friction due to dentine chips in the flute	Remove dentine chips regularly in the interim stand
Narrow canal anatomy	Recapitulate with a C-PILOT® ISO size 10 hand instrument. If needed, go back to the previous Mtwo® instrument and proceed with preparation
